

ABOUT US

Established in 2017, Team Sammard is VIT Vellore's official rocketry team - we are a passionate group of innovators and engineers turning ambitious ideas into reality. Driven by the ultimate goal of building sounding rockets and canister satellites, we advance student-led aerospace innovation by competing internationally at NASA CanSat, IN-SPACE CanSat, and IREC, while actively organizing national events to cultivate a thriving aerospace culture.

Future Plans

Our vision is to contribute to India's growing space technology ecosystem through research, innovation, and advanced rocketry. With the support of our industry partners, we aim to bring our 10K feet sounding rocket to Indian soil, creating opportunities to test technologies and build stronger industry-student collaboration. Beyond launches, we hope to inspire more young engineers to explore the space sector and pursue careers in this rapidly growing field.

OUR COMPETITIONS

● IREC

We proudly launch our rockets at IREC, the world's largest collegiate rocketry competitions. Over the years, our fleet - Vajra (2023), Agneya (2024), and Airavata (2025) showcased our technical expertise in the 10K COTS category. With Airavata, we placed 1st in India in this category, secured the Early Bird Award, and ranked 28th globally in Design and Build Quality. With Mission Udbhava (2026), Team Sammard took a monumental leap into the 10K SRAD category, designing and manufacturing our own solid rocket engine entirely in-house. Successfully launched and recovered, Udbhava secured 3rd place in Asia under 10K SRAD Category, marking a major milestone in our journey towards fully indigenous, high-performance rocketry.

● CANSAT

We have a unique approach on Canister Satellite based problem statements. We build complex subsystems under tight mass and space constraints, which is how on our first attempt at NASA CanSat, we placed 18th globally and 7th in Asia-Pacific, while our work with IN-SPACE CanSat continues to showcase our presence at the national level.

Why Us?

Since 2017, Team Sammard has continued to grow and explore new frontiers. We are building meaningful connections with industry leaders who share our interest in advancing aerospace technology. Working with us offers companies an opportunity to engage directly with new student R&D ideas, see them being applied in real flight environments, and connect with a team developing practical expertise. For us, these partnerships are opportunities to learn, build, and grow alongside the aerospace industry.

RELATED ORGANIZATIONS

PLATINUM SPONSOR

Project Udbhava

Our latest rocket (2026) built for 10k feet operates entirely on systems designed and built in-house:

- Project Rudra: N Class SRAD solid rocket engine.
- Sirius: Custom STM32 based flight computers.
- Integrated GCS: SRAD antennas for long-range communication and CyberDeck for data visualization.
- Airbrakes: 4-leaf mechanism controlled by ESP32 based PCB Bhagat-C.
- MARK: Scientific payload onboard Udbhava used to measure Coefficient of friction in microgravity.
